

Ojá-Ẹwà Mobile

End-to-end QA walkthrough for testers still learning the platform

Version 1.0 · Mobile build 39 · 2026-05-15

If you can read this document, you have everything you need.
Take your time. Read first. Test second.

What's in this guide

1. About this guide & how to use it
2. Getting set up (accounts, devices, credentials)
3. How to report a bug — the template every report must follow
4. Severity: how to decide if it's a fire
5. The 16 core flows you must test, in order
 - a. Sign-up & OTP
 - b. Login, logout, forgot password
 - c. Browse, search, filter
 - d. Product details & reviews
 - e. Cart (add, change quantity, remove)
 - f. Addresses (Nigerian + international)
 - g. Checkout: shipping quotes
 - h. Checkout: payment & callback
 - i. Order tracking
 - j. Return request flow
 - k. Become a seller (onboarding)
 - l. Seller dashboard, products, orders
 - m. Badges (White / Gold / Green)
 - n. App services (CAC, NEPC, adverts)
 - o. Notifications
 - p. Account settings & profile
6. Multi-currency: what changes when the buyer is outside Nigeria
7. UI glitches checklist — what to look at on every screen
8. Edge cases & negative tests you should always try
9. Performance, network, accessibility
10. Known issues already filed (don't re-report)
11. Appendix: glossary, useful URLs, slash-command quick reference

1. About this guide & how to use it

This guide is written for someone who has never QA'd a marketplace app before. It is long on purpose. Read sections 1–4 once cover to cover. Then, every testing session, work through section 5 step by step, and keep section 7 open on a second screen so you remember what to look for on every screen.

What does "Ojá-Ẹwà" do?

Ojá-Ẹwà is an African marketplace. Two kinds of people use it: **buyers** who shop for fashion, beauty and art, and **sellers** who run a shop on the platform. The same person can be both. Sellers can also get **badges** (White, Gold, Green) which signal trust and unlock higher product limits. Buyers in Nigeria pay in Naira; buyers outside Nigeria pay in their local currency (GBP, USD, EUR, etc.).

Your job as a QA tester

- Pretend you are a real user. Do real things. Place real (test) orders.
- If something looks wrong, looks weird, looks slow, looks ugly, looks confusing, *write it down*. You are not bothering anyone.
- Test on at least two devices: one phone, one tablet or a small phone. Both Android and iOS if you have them.
- Test on Wi-Fi *and* on mobile data (4G/3G). Many bugs only appear on slow networks.
- Test in **dark mode** and **light mode**. We have had real bugs where text was invisible on one of them.

Rule of thumb. If you have to think "should I report this?" — report it. Worst case the dev closes it as "by design" and you've lost nothing. Best case you saved a real user a bad day.

2. Getting set up

2.1 Installing the app

- **Android:** install the latest internal build from the link in the QA WhatsApp group. Allow installs from this source when prompted.
- **iOS:** install via TestFlight using the invite emailed to you.
- After install, force-close the app and open it once before testing — this clears any half-initialised state.

2.2 Test accounts

Account	Email	Password	What you can do
Main test user	test@ojaewa.com	password123	Buyer + seller (Lizza Atelier shop). Use this for most happy-path testing.
Dev user	dev@ojaewa.com	password123	Buyer + seller (second shop). Useful when testing buyer-to-seller flows where you need <i>two</i> accounts.
Admin panel	admin@ojaewa.com	Admin@1234	Admin dashboard only — not the mobile app.

Never use real card details. Use Flutterwave's **test card**: 5531 8866 5214 2950 , expiry 09/32 , CVV 564 , PIN 3310 , OTP 12345 . If the form asks for a 3-D Secure OTP, the same 12345 works.

2.3 Backend environment

The mobile app talks to the production backend at `https://ojaewa-pro-api-production-2254.up.railway.app` . You don't need to do anything with this — it's just useful to know in case you want to share an API response with a developer.

2.4 What to have ready before you start

- A note-taking app (Notion, Google Docs, Apple Notes — whatever you're fast in).
- A way to take screenshots and short screen recordings.
- Two real phone numbers (one for primary, one for second account / OTP tests).
- Two real email addresses you can read.

3. How to report a bug

Every bug report you file must have all of these fields. If even one is missing, the developer has to come back and ask. That wastes both your time and theirs.

Field	What goes here
Title	One sentence in the form: <i>"On [screen], when I [action], [unexpected thing happens]"</i> . Example: "On Checkout, when I tap Place Order with no shipping selected, nothing happens."
Severity	Critical / High / Medium / Low — see section 4.
Build	The version number from the app's Account → Settings → About screen, e.g. <code>1.0.0 (39)</code> .
Device & OS	e.g. "iPhone 13, iOS 17.4" or "Tecno Spark 10, Android 13".
Network	Wi-Fi / 4G / 3G / Airplane mode.
Account	Which test account you were logged in as.
Steps to reproduce	Numbered. Anyone should be able to follow them and hit the same bug. Don't skip "obvious" steps — write them anyway.
Expected	What you thought would happen.
Actual	What actually happened. Quote any error text exactly.
Screenshots	At least one. For visual bugs, attach both the broken screen <i>and</i> a screen where it looked right, so the dev can compare.
Screen recording	For anything timing-related, gesture-related, or hard to describe in words.
Frequency	Always / Sometimes / Once. If sometimes, describe what you noticed about when it happens.

Example of a good bug report

Title: On Order Confirmation, "Place Order" tap shows "Failed to create order: Unexpected error" even though the order is created.

Severity: Critical

Build: 1.0.0 (38)

Device: Pixel 7, Android 14

Network: Wi-Fi

Account: test@ojaewa.com

Steps to reproduce:

1. Login as test@ojaewa.com
2. Add any product to cart

3. Open Cart, tap Checkout
4. On Order Confirmation, pick the default Nigerian address
5. Pick the cheapest shipping option
6. Tap "Place Order"
7. Tap "Flutterwave" in the payment sheet

Expected: Flutterwave checkout page opens.

Actual: Red snackbar: "Failed to create order: Unexpected error."
But if I go to Account → My Orders, the order is actually there
with status "pending".

Frequency: Always (5/5 attempts).

Screenshots: attached - 01-snackbar.png, 02-order-was-created.png

Tip. If you find a bug, before you file it, search the existing bug list for similar wording. It's better to add a comment to an existing report ("I see this too on iOS") than to file a duplicate.

4. Severity: how to decide

Level	Meaning	Examples
Critical	The app crashes, data is lost, money is wrong, or a core flow (sign-up, checkout, payment) is completely broken.	App crashes on launch · Order placed but never appears · Buyer charged the wrong amount · Cannot complete checkout at all
High	A core flow has a serious bug but there is a workaround, or a non-core flow is completely broken.	Search returns no results unless you tap twice · Notifications don't open the right screen · Seller cannot edit a product but can create one
Medium	Visible incorrect behaviour or visual bug that doesn't block the user.	Date format wrong · Subtotal+delivery doesn't equal total by ₦0.01 · Icon misaligned by a few pixels · Badge label says "Black" but the badge is white
Low	Cosmetic, nice-to-have, or a copy/wording issue.	Typo · Image alt text · Capitalisation inconsistent between screens

Anything involving money, payments, or wrong currency is always at least High. If you can't tell whether the user was overcharged, undercharged, or charged in the wrong currency, file it Critical and let the developer downgrade it.

5. Core flows to test

Test these in order. Each flow's title is followed by what to do and a short list of what to watch for. The bullets are not exhaustive — apply the UI glitches checklist (section 7) to every screen on top of these.

5.a Sign-up & OTP

1. Open the app fresh (uninstall + reinstall if needed). Tap **Sign up**.
2. Enter first name, last name, email, phone, password. Use an email you can read.
3. Submit. You should receive an email OTP within ~60 seconds.
4. Enter the OTP. You should land on the home screen.

Watch for:

- Submitting with an empty / invalid email or short password — the form should show inline errors, not crash.
- Re-using an existing email — should say "Email already in use", not a generic 500.
- OTP that is expired or wrong — should say so, not silently fail.
- Tap **Resend** — should be on a cooldown (e.g. 30s) and not let you spam.
- Phone number formatting: Nigerian numbers like `+2348012345678` and `08012345678` should both be accepted.

5.b Login, logout, forgot password

1. Logout from the previous session.
2. Login with `test@ojaewa.com` / `password123`.
3. Logout. Tap **Forgot password**. Enter the same email. Check the inbox for a reset link / OTP.
4. Set a new password. Login with it. Then revert it back to the original.

Watch for:

- Wrong password — message should not reveal whether the email exists.
- Logout from a stale token — should land on the login screen, not get stuck.
- "Remember me" / biometrics if present — log in, kill the app, reopen — does it remember you?

5.c Browse, search, filter

1. From Home, scroll through every category. Tap into one.
2. Use the search bar with: a known product name; a partial name; a category-only search; a nonsense string.
3. Apply filters (price, size, category, gender). Combine them. Clear them.

Watch for:

- Empty states — when nothing matches, is the message clear? Is there a "clear filters" button?
- Lazy load / pagination — scroll fast, do duplicates appear or does the list jump?
- Pull to refresh — does it work? Does it show the spinner correctly?
- Image placeholders — broken images should show a placeholder, not a grey hole.
- Prices for non-Nigerian users (see section 6).

5.d Product details & reviews

1. Open any product. Read the description. Tap the image to expand if possible. Scroll reviews.
2. Tap into the seller's shop link.
3. Go back. Add to wishlist. Remove. Add again.

Watch for:

- Long descriptions — does the text get cut off? Is there a "Read more"?
- Out of stock state — is it clear the user cannot add to cart?
- Seller badge — should be one of **White / Gold / Green**. **Never blue, never black**. If you see a blue or black badge anywhere, file it as Medium.
- Price currency matches the buyer's delivery country.

5.e Cart

1. Add 3 different products from 2 different sellers.
2. Change quantities. Remove one. Re-add it.
3. Close the app, reopen — the cart should still be there.

Watch for:

- Subtotal updates when you change qty without a full page reload.
- Removing an item — does it animate cleanly or jump?
- If a product becomes unavailable, the cart should warn you, not silently keep it.

5.f Addresses

1. Account → Addresses → Add. Enter a Nigerian address.
2. Add a second, international address (e.g. UK: *10 Downing Street, London, England, SW1A 2AA, United Kingdom*).
3. Make each the default in turn. Edit one. Delete one.

Watch for:

- State field — for Nigeria, it should accept "Lagos" / "Lagos State" both. For UK, "England" / "Greater London" etc. should be accepted.
- Address validation errors — should be human-readable.
- If the address fails Shipbubble validation (a Nigerian street that doesn't match), the error should say "could not match this address" — **not** "temporarily unavailable". The wording matters.

5.g Checkout: shipping quotes

1. With items in cart, tap Checkout. Select a Nigerian address.
2. Wait for shipping options to load. You should see one card per seller in the cart with one or more courier choices each.
3. Pick the cheapest option for each seller.
4. Repeat with the UK address selected.

Watch for:

- Loading state — is there a spinner? Does it ever finish?
- "No shipping options" — wording should explain why.
- Each option shows: courier name, estimated days, price in the correct currency.
- Switching address re-fetches quotes — confirm the prices update.
- Currency on shipping quotes matches the address's country.

5.h Checkout: payment & callback

1. With shipping selected, tap **Place Order**.
2. In the payment sheet, tap **Flutterwave**.
3. Complete the test card payment (see section 2.2).
4. Wait to be redirected back into the app. The order should appear in My Orders with status *paid*.

Watch for:

- **The bug we just fixed.** If you see "Failed to create order: Unexpected error" but the order shows up in My Orders anyway, file it — that means the fix has regressed.
- The Flutterwave page should show your name, email and the correct amount and currency.
- After success, the app should automatically return you to the order page. If it stays stuck on the browser, file it.
- Cancel the payment on Flutterwave — what does the app show? An order should exist in "pending" state, and you should be able to retry payment.
- Subtotal + Delivery fee should equal Total exactly (now — not off by ₦0.01).

5.i Order tracking

1. Open any paid order from My Orders.
2. Read every field on the page. Tap Tracking.
3. For multi-seller orders, each shipment should be tracked separately.

Watch for:

- Empty fields are shown as "—" not as "null" or empty strings.
- Order date and shipped date are sensible (in the past, in the user's locale format).
- Each stage in the timeline lights up correctly as the order progresses.

- For international orders, the order detail page shows both the converted total *and* the original NGN amount + exchange rate.

5.j Return request flow

1. From a delivered order, tap **Request return** on a shipment.
2. Pick a reason, submit.
3. Check the order detail — there should be a return request line with status "requested".

Watch for:

- The return deadline is correctly shown.
- You cannot request a return twice for the same shipment.
- You cannot request a return on an undelivered shipment.

5.k Become a seller (onboarding)

1. Use a brand-new account (sign up a fresh one). Tap **Start selling**.
2. Fill the multi-step seller registration form. Upload required documents (any image is fine for QA).
3. Submit. The account should now be "pending" until admin approves.

Watch for:

- Each step's validation — leave a required field empty, submit, see the inline error.
- NIN and BVN should be required **only for Nigerian** business profiles, not international.
- Uploads show a loading spinner. Disconnecting Wi-Fi mid-upload should show a clear error.
- Keyboard should not cover the input you are typing into.

5.l Seller dashboard, products, orders

1. Login as `test@ojaewa.com` (Lizza Atelier). Go to Your Shop → Dashboard.
2. You should see Lizza's seeded products in the products tab. **If you see zero products and the badge below the title is still loading, that is a bug — report it.**
3. Add a new product. Edit it. Soft-delete it.
4. Open the Orders tab. Place an order (from a different account) to one of Lizza's products, pay for it, then come back here as Lizza and update its status.

Watch for:

- Product upload — image preview, weight/dimension fields, price formatted correctly.
- Hit the product upload limit (currently 10 for White Badge sellers) — the UI should disable the "add" button with a helpful explanation, not silently fail.
- Order list shows customer name, order date, status. Tapping opens the seller-side order detail with the shipment and label.
- Status transitions (pending → processing → shipped → delivered) should only allow forward moves.

5.m Badges (White / Gold / Green)

1. As an approved seller, go to Account → Verifications → Badges.
2. The list should show exactly three options: **White (Certified Authentic)**, **Gold (Heritage Artisan)**, **Green (Sustainable Innovator)**.
3. Tap into one. Upload supporting docs. Submit. Pay through the in-app subscription (this uses the device's app store / Play store).

Watch for:

- **No blue badge anywhere.** Old screenshots and old test accounts may still show "Design Excellence" — file as Critical until cleared.
- White Badge has a light grey/cream background with dark text.
- Gold Badge has a gold background with dark text.
- Green Badge has a dark-green background with white text.
- The badge label on the seller profile, on product cards, and on the account screen should all match.

5.n App services (CAC, NEPC, adverts)

1. Account → Services → CAC Registration. Fill the form. Pay (Flutterwave test card).
2. Account → Services → NEPC. Same drill.
3. Account → Adverts → Place an advert. Upload an image. Submit.

Watch for:

- CAC and NEPC use Flutterwave (not Paystack, not IAP). If the payment sheet shows anything else, that's a bug.
- Advert placement currently has *no* payment step — it just submits. If a payment step appears, file it.
- Image upload shows a loading state — try to submit during upload, the submit button should be disabled.

5.o Notifications

1. Grant notification permission on first launch (if you denied earlier, reinstall to get the prompt).
2. Place an order, mark it shipped from the seller side — you should get a push notification within ~10 seconds.
3. Tap the notification — it should deep-link to the order detail.
4. Open the in-app Notifications screen. Mark one as read. Mark all as read.

Watch for:

- Notifications still arrive when the app is fully closed.
- Tapping a notification while the app is open updates the in-app counter.
- Unread counter on the bell icon matches the list.

5.p Account settings & profile

1. Account → Edit profile. Change first name, save. Reload — does it stick?
2. Toggle each notification preference. Settle each at the end.
3. Change theme (light/dark/system). Visit every major screen in each theme.
4. Logout. Login again.

Watch for:

- Dark mode — any white-on-white or black-on-black text, anywhere, is a Medium bug.
- "Delete account" — should ask for explicit confirmation and not be one-tap.

6. Multi-currency: what changes for non-Nigerian buyers

When the buyer's delivery address country is *not* Nigeria, the entire app switches into the buyer's currency:

Address country	Currency
Nigeria	NGN ₦
United Kingdom	GBP £
Germany, France, Italy, Spain, Netherlands, Belgium, Austria, Portugal, Ireland, etc.	EUR €
Ghana	GHS
Kenya	KES
South Africa	ZAR
USA, Canada, and anywhere else not listed	USD \$

Test these specifically:

- With a UK default address, browse products — prices should be in GBP everywhere (home, search, product detail, cart).
- Check the conversion looks sane: a ₦100,000 product should be roughly £45-£65 (the rate is fetched live from Flutterwave).
- Checkout in GBP — the Flutterwave page should also show GBP, and only show **card** as the payment method (no bank transfer, no USSD).
- On the paid order detail, you should see: total in GBP, original NGN amount, and the exchange rate used.
- Switch the default address back to Nigeria — prices should switch back to NGN immediately.

If you ever see a non-NGN buyer charged in NGN, or vice versa, file it Critical immediately.

7. UI glitches — apply this checklist to every screen

Open each major screen and tick this list mentally. Anything that fails goes into your notes.

Text & copy

- No raw `null`, `undefined`, `[Object]`, or unfilled `{placeholder}` visible anywhere.
- No text overflowing its container or being clipped mid-word.
- No mixed languages or character-encoding artefacts (e.g. `â€™` instead of an apostrophe).
- Currency symbol matches the buyer's country. Decimal places consistent.
- Dates in a sensible format (e.g. "5 May 2026", not "2026-05-05T14:23:00Z").
- Plurals are correct: "1 item" not "1 items"; "0 items" not "0 item".

Layout & colour

- Buttons and tappable areas large enough for a thumb (44pt minimum).
- Nothing cut off by the notch, status bar, or the home indicator on iPhone.
- Bottom nav doesn't overlap form inputs.
- Light mode: no white-on-white. Dark mode: no black-on-black.
- Disabled buttons look disabled (faded), enabled buttons look enabled.
- Loading states: skeletons or spinners exist on every list/detail screen.

Behaviour

- Back button always works and goes where you'd expect (not to the home screen mid-flow).
- Tap a button twice quickly — does the action run twice (double order, double notification)?
- Open the keyboard — does it cover the field you're editing?
- Rotate the device (if supported) — does the layout survive?
- App backgrounded for 5 minutes, then resumed — does state survive? Does data refresh?
- Hot-swap network (Wi-Fi off mid-action) — does the error message make sense?

Images

- Product images load, with a placeholder while loading and a fallback if the URL is broken.
- Avatar / business logo never shows a stretched / distorted image.
- Uploaded images survive a back-out and re-entry (don't disappear after navigation).

8. Edge cases & negative tests

The happy path is rarely where bugs hide. These are the things to *try to break*.

Inputs

- Paste 5,000 characters into every text field. Does the form survive? Does it truncate cleanly?
- Enter emoji 🐼 in names, addresses, product names.
- Enter only spaces. Enter leading/trailing spaces.
- Enter negative numbers and zero into quantity / price / weight.
- Enter SQL-looking text: `' ; DROP TABLE users; --` — the form should treat this as just a string, not error.

Network

- Turn off Wi-Fi mid-checkout. Mid-image-upload. Mid-login. Each should give a clear "no internet" message and let you retry.
- Throttle to 3G (Android dev settings or iOS Network Link Conditioner). Anything take more than ~5s without feedback? File it.
- Hit a flow twice in quick succession (e.g. tap Place Order twice within 1s). You should not get two orders.

Auth & sessions

- Login on two devices with the same account. Take an action on device A. Does device B still work or does it 401?
- Leave the app open for 24h, then come back. Does it auto-refresh the token or kick you to login?
- Sign up with an email containing `+` e.g. `qa+test1@example.com` — many backends choke on this.

Data

- Place a single-item order, place a 10-item order, place a multi-seller order. Compare totals on each.
- Order, cancel before payment. Order, pay, cancel after pay. Order, pay, deliver, return.
- Buy from your own shop (same account is both buyer and seller). Should be blocked or clearly handled.

9. Performance, network, accessibility

Performance

- Cold start: time from tapping the icon to a usable home screen. On a mid-range Android, this should be under 4 seconds.
- Scroll a long product list — does it stutter? Drop frames?
- Image-heavy screens — do they keep memory under control or does the app slow down over time?

Network

- Note any screen that takes longer than 5 seconds without a loading indicator. Even on 3G.
- The app should still let you browse *your own* profile, orders, and saved data when offline (if cached). Anything that requires a fresh fetch should say so.

Accessibility

- Turn on the OS's **large text** setting (iOS: Settings → Display & Brightness → Text Size; Android: Settings → Display → Font size). Does the UI still work or do buttons collapse?
- Turn on a screen reader (VoiceOver / TalkBack) on one screen — do important elements have labels?
- Sufficient colour contrast on text — squint at the screen; can you still read body text?

10. Known issues — please don't re-report

- "Failed to create order: Unexpected error" snackbar at checkout despite the order being created — **fixed in build 39+**. Verify it is gone; only re-report if you see it again.
- Seeded user `test@ojaewa.com` (Lizza Atelier) showing a blue "Design Excellence" badge — **fixed**. Verify the badge now reads as one of White / Gold / Green.
- Lizza's seller dashboard showing zero products — **fixed via data migration**. After the next deploy, her shop should show ~10 Lizza Atelier products. If still empty, re-report.
- Black/Blue badge wording on the Account screen — **renamed to White**. Verify "White Badge Active" appears, never "Black Badge Active".
- Subtotal + delivery fee not equalling total by ~~¥~~0.01 on FX orders — **fixed**. Re-test on a GBP / USD order and confirm.

Always re-test "fixed" items in every new build. Fixes can regress. If you see one of these again, file it with the title prefixed by "*Regression:*".

11. Appendix

Glossary

Term	Meaning
Shipbubble	The logistics provider Ojá-Ẹwà uses to validate addresses and book shipments inside Nigeria.
Flutterwave	The payment processor. Buyers pay through Flutterwave's hosted page.
Quote / quote_reference	A shipping rate that has been issued for a specific cart + address. Quotes expire after 30 minutes.
Escrow	Funds are held until the buyer marks the shipment delivered, then released to the seller.
Badge	Trust signal a seller can purchase (White / Gold / Green). Each unlocks a higher product upload limit.
NGN / FX	NGN = Nigerian Naira. FX = foreign exchange, i.e. non-Naira currencies.
Tx_ref	The unique reference number Flutterwave attaches to a transaction. Useful when sharing payment issues.

Useful links

- Production API base URL: `https://ojaewa-pro-api-production-2254.up.railway.app`
- Flutterwave test card reference: `5531 8866 5214 2950 · 09/32 · 564 · PIN 3310 · OTP 12345`
- Admin dashboard: ask your team lead for the URL — not in the mobile app.

One-page checklist for every test session

1. Note the build number and device.
2. Force-close the app and reopen.
3. Run the 16 core flows in order. Tick each one off in your notes.
4. On every screen, apply the UI glitches checklist (section 7).
5. End by trying 3 edge cases from section 8 you haven't tried yet.
6. For each bug, file using the section 3 template. Attach screenshots.
7. Summarise: total bugs filed, by severity, in a one-paragraph note at the end of the session.

Last updated 2026-05-15 against mobile build 39 and API at `2026_05_15` . If you find this guide is out of date, please tell your team lead — it should be revised every two sprints.
